

Are you registered but not using the My Health Record system?

The next step to start using the My Health Record system is easy. Here are a few tips to help you get going:

- 1 Confirm that your clinical software supports digital health:** the majority of the leading clinical software vendors have incorporated the My Health Record system functionality. If you are receiving the ePIP, your software will have it.
- 2 Discover how the digital health system works:** we recommend you and your staff access the tutorials on how the key features work in a number of software products. Go to www.digitalhealth.gov.au for software demonstrations, videos and checklists to help you remember the steps as you start to use the system.
- 3 Practice makes perfect:** you can practice on our training environment and experience how easy it is to use. It allows you to create and demonstrate certain clinical simulations using any of the supported software packages – for example, a scenario involving the uploading of a Shared Health Summary, using simulated clinical data for a fictitious patient, and a simulation of the My Health Record system. Contact us to book a time to use the training environment.
- 4 Have a go!** We recommend starting with the patients who will benefit the most (chronic disease, young families, aged care, travellers, rural patients, etc). If you don't know how to help your patient register, have a look at the process of Assisted Registration.
- 5 Make use of the opportunity and clean up your clinical data:** It is important to have up-to-date health summary data to ensure accurate clinical information is shared. Advice and tips on maintaining quality health records are on the website too.
